At a glance

Every day runs the same four phases, and only names that survive each filter move down. Full rules and tables: Daily Shortlist Workflow

daily shortlist workflow · 4 phases, 6 steps

The range line can be horizontal or inclined, but the break must come with good volume.

Daily Shortlist Workflow

Oct 14, 2026 · @Nitesh Chawla

A stock makes tomorrow's list only if it passes all five rules below, then survives three evening filters: dashboard, weekly chart, range lines. Built from the Aeroflex 14/10/2026 playbook post.

The five rules

1. **No range lines = no trade.** You must be able to draw a clean line across the highs the price keeps stopping at, touched at least 2–3 times. It can be horizontal or inclined (the falling top of a wedge or triangle).
2. **SEPA has happened.** A prior move up on big volume is already on the chart (roughly 30%+ in 1–3 months).
3. **Tight near the high.** The stock is consolidating close to its high, so any volume meets little overhead supply.
4. **1 to 3 ADR from the 10-week line.** Above 1 means it has moved. Under 2 = full size, 2–3 = half size, above 3 = no new swing.
5. **Trend is green.** Price is above a rising 10MA and 20MA (green cells in the dashboard).

Evening step 1: dashboard filter (15 min)

Go through Tomorrow's list P1, P2 and P3 and keep only rows that are green across the board. Target: 15–20 names; untick the rest.

Column	Keep if	Why
Sector / group	Holding ≥ 60%, top of Leadership	Breakouts only pay where the group is working
ADRs from 10w	1 to 3 (green)	Moved (SEPA) but not extended
10MA % and 20MA %	Both green, MAs rising	Trend is up
Rel tight	≤ 0.8 (use previous NR4 on a breakout day)	Coiled, ready to move
Off 1M hi %	Within about 1 ADR	Close to the pivot, little overhead
Avg vol / dvol	Green liquidity colour	Easy in and out

Column	Keep if	Why
Situation	Not 5 · Weak / Failed	Failed breakouts are out

Also cap the list by regime (Aggressive 6, Normal 4, Defensive 2 open positions) and keep at most 2 names per sector.

Evening step 2: weekly chart flip (10 min)

Flip the 15–20 names on the weekly chart, about 10 seconds each, and keep the 6–10 that stand out. This is how Aeroflex was found.

Keep it if you see all three:

- **The SEPA leg:** a clear prior advance on rising volume.
- **Tight weekly bars near the high:** 2–6 weeks of small ranges and closes bunched just under the high.
- **Volume drying up in the base:** shrinking weekly volume while price holds.

Drop it if the weekly bars are wide and sloppy, the stock is far below its high, or it is a fresh base with no prior move.

Evening step 3: draw the range and set alerts (15 min)

For each survivor, draw the lines below using both the daily and the 1-hour chart. If you can't draw a clean range line, drop the stock: no range lines, no trade. Final list: 5–7 names, ranked by group strength and tightness.

Once the range is drawn Qullamaggie-style, the breakout is required. The price must clear the range high with good volume: Rel vol at time 2 or higher, on pace for the biggest volume bar since the base began. A poke above the line on ordinary volume is not a breakout. No clean break with volume, no entry.

Use both timeframes:

- **Daily chart: find the range.** It confirms the base, the SEPA leg behind it, the cluster of highs and any older higher swing overhead. If the range isn't obvious on the daily, it isn't a range.
- **1-hour chart: place the line exactly.** It shows the touches the daily bars hide (ABDL's 729 was hit 3–4 times), whether the latest push was rejected at the line, and the higher lows that form the floor. Take the alert price from the hourly line.

- **If they disagree:** the daily decides whether it's a setup, the hourly decides the exact level. If the hourly shows a zone rather than a line, put the alert above the top of the zone.

1. **Range high (the alert):** a line across the highs the price keeps stopping at, horizontal or inclined, touched at least 2–3 times. Not the single outlier wick.
2. **Older higher swing (resistance):** if it sits within 1 ADR above the range high, trade half size or wait for it to clear.
3. **Rising lower line (the floor):** the higher lows. Not an alert; a close below the last swing low means the setup is dead.
4. **Set the TradingView alert** at "crossing up" a few ticks above the range high. For an inclined line, put the alert on the drawn trend line itself, so it moves with the line.
5. **Save it:** tick it in Tomorrow's list and note the pivot, the floor and full or half size.

Premarket check (5 min)

Premarket only confirms the list; it never adds names to it.

- **Shortlist only:** look at the 5–7 names, nothing else. A premarket leader that's already on the list (like Aeroflex) is the one to watch first.
- **Gap check:** a gap more than 1 ADR above the pivot usually makes the low-of-day stop too wide. Skip it or trade half size.
- **News and earnings:** an earnings date inside the next few days means skip or half size.
- **Market tone:** if index futures are weak, lean to fewer entries, not more.

At the open: act only on an alert

If a stock didn't alert, it doesn't exist today. When an alert fires, take the trade only if every line is true:

- [ ] The alert fired in the first 15–30 minutes.
- [ ] Rel vol at time is 2 or higher, on pace for the biggest volume bar since the base began.
- [ ] The 1-minute opening range high clears the pivot (the range line, or yesterday's high when that is the top of the range).
- [ ] The low-of-day stop is no more than 1 ADR below the entry.
- [ ] Open positions stay within the regime cap, and at most 2 per sector.

Situation	Size
On the list, under 2 ADR from 10w, big volume, clean range break	Full planned risk
2–3 ADR from 10w, resistance within 1 ADR, or ordinary volume	Half risk
Inclined line broken, but an older horizontal high sits within 1 ADR above	Half risk, or wait for that high to clear
Over 3 ADR from 10w, stop wider than 1 ADR, or not on the list	Skip

Can't watch the open? Place a GTT just above the pivot with a stop at most 1 ADR below as the backstop.

After the close: manage and log (10 min)

Only the stop is live during the day; every other decision is made on the close.

Close	Action
Above the pivot, top third of the range, strong volume	Hold. Stop at low of day; move to breakeven after day 2–3
Below the pivot, upper half of the range	Hold with the stop; it must take the pivot next session or exit on the close
Lower half of the range with a long upper wick	Sell near the close (failed breakout)
Stop hit at any time	Out, no re-entry that day
Up 3–5 days	Sell a third to a half; trail the rest on a close below the 10MA

Then log the day: tag new breakouts in the scanner, and post each trade in the Discord playbook (why it was on the list, the chart with range lines, entry, stop, outcome).

Worked examples

Stock	What happened	Lesson
Aeroflex (14 Oct)	On the shortlist premarket, green in the dashboard, tight weekly bars near the high after SEPA, range line drawn; entered on the 1-minute ORH as it broke the range at yesterday's high	The full workflow: this is the template
ABDL	Continuation: SEPA, volume came, now tightening around the 10MA; entry was on the diagonal break, under the 729 horizontal	The inclined-line break worked; with the 729 high within 1 ADR above, it was a half-size entry until 729 clears
TFCILTD (friend)	Bought the day-1 break of a 5-week base on the biggest volume in weeks; added at 3.3 ADR from 10w	Day 1 = A entry. The add was above 3 ADR, so not a new swing for you
Mawana Sugars	Cleared its base on 7.9x volume, but 3.1 ADR from 10w by the time it was found	Over 3 = no new swing. Wait for a flag and a new range line
